Pasture land in the United States as a whole	2		
Geographical distribution of farm pasture	3		

SOURCE OF DATA.

The figures on pasture land on farms in the United States presented in this bulletin were obtained from a tabulation of the agricultural schedules collected by the Bureau of the Census in 1910. Owing to the fact that the census period is limited to three years, the Bureau of the Census was unable to tabulate this item. When, however, the necessity of increasing food production in the United States made it particularly important to ascertain the amount and location of agricultural land not at present utilized for raising crops the Bureau of the Census granted permission to the Office of Farm Management to undertake the tabulation of pasture land. Although the schedules were collected seven years ago, it was thought that no great changes in distribution of pasture land had occurred since 1910 and that in any case these data were of great value as the first enumeration ever tabulated of the amount and distribution of pasture land on farms in the United States. (See note on page 11.)

The census inquiry on which this tabulation is based is as follows:

PASTURE LAND: Acres in this farm used exclusively for pasture in 1909:

	Acres.
Woodland pasture, covered with pasture grasses, but containing more or less scattered timber	
Improved land in pasture, but which can be plowed or mowed	
All other pasture land	

The tables in this bulletin show the returns for each of the three types of pasture for the United States as a whole, for geographic divisions, for States, for counties, and for the Territory of Hawaii. No data on pasture were collected for Alaska or Porto Rico.

ARRANGEMENT OF MATERIAL.

Tables I and II present, respectively, the acreage of farm pasture land by geographic divisions and States, and by counties. For comparative purposes certain other items are included in these tables. The total land in farms is taken from the census reports. The land in crops also is taken from the census reports but includes estimates for the acreage of fruit crops, which are not reported in the census. These estimates were obtained by dividing the number of trees given in the census by the average number of trees per acre as estimated by the Bureau of Plant Industry. The figures for the item "All other farm land" are obtained by subtracting those for the crop and pasture land from those for the total farm land. This item includes woods not pastured, yards and barnyards, roads, fallow and waste land. (See note 2, page 12.)

Table I also shows the percentage distribution of farm land into its various classes, and Table II, the percentages for crop land and pasture land by counties. A column showing the number of acres in pasture per 100 acres in crops also is included in Tables I and II.

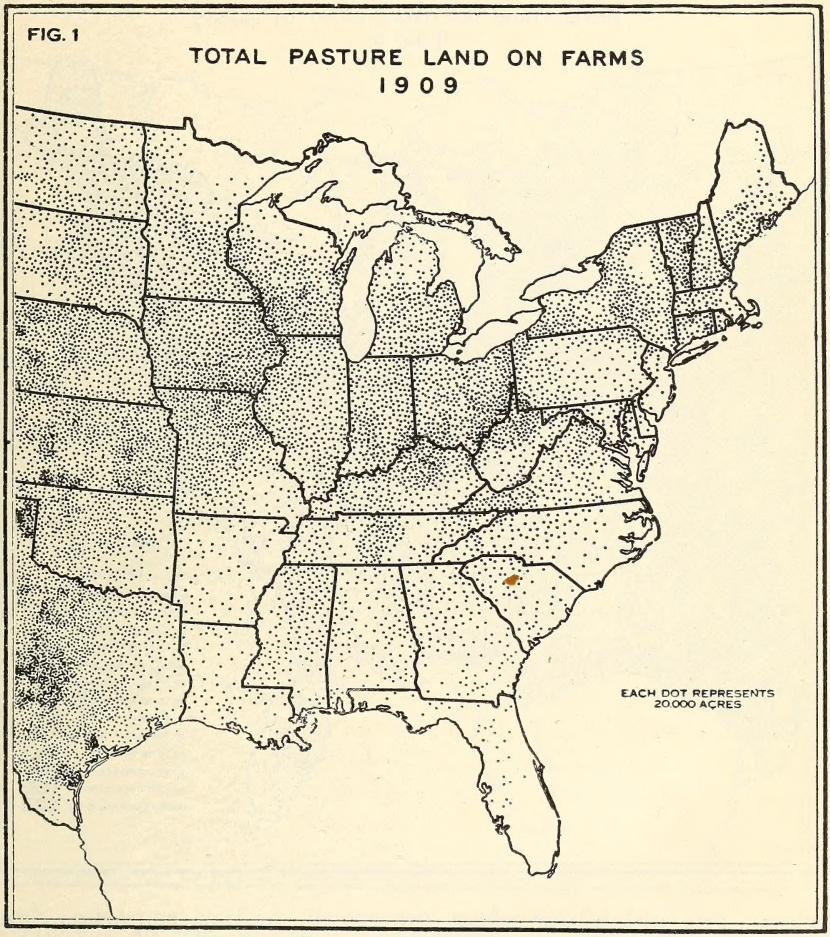
FARM PASTURE LAND IN THE UNITED STATES AS A WHOLE.

Of the total farm land, which comprised about 879,000,000 acres in 1909, somewhat more than one-third was in crops, about one-third was in pasture, and somewhat less than one-third comprised all other kinds of farm land. The fact that there was nine-tenths as much pasture land as crop land is enormously significant in connection with the possibilities of expanding crop production. It must be noted, however, that a large part of the pasture land is unimproved, about 99,000,000 acres being in "woodland pasture" and 108,000,000 acres "other unimproved pasture"; but even the improved pasture alone represented over 84,000,000 acres, or nearly one-tenth of the total land in farms. This improved pasture doubtless consists largely of land that is pastured in rotation with crop production in intermediate years. It may be used for crops three years out of four, two years out of three, or one year out of two, but most of it undoubtedly is arable land; in fact the definition of this type of pasture is "improved land in pasture but which can be plowed or mowed." Of the unused farm land, that is, land not in crops or pasture, which comprised about 269,000,000 acres, or 30.6 per cent of the total land

in farms, about one-third, 10.4 per cent, was in woodlots, and two-thirds, 20.2 per cent, comprised fallow land, waste land, land in farmstead, roads, etc.

GEOGRAPHIC DISTRIBUTION OF FARM PASTURE.

Figure 1 shows the geographic distribution of the total pasture land on farms, each dot representing 20,000 acres. The map includes only the portion of the United States east of longitude 99° W., since



climatic conditions, the extent to which the public land has actually or nominally been transformed into farms, and other factors are so diverse in the Western States that comparison of the statistics of pasture land in the East with those for the West is impossible. It will be seen that the greatest concentration of farm pasture is in Texas, Kansas, Nebraska, Missouri, and Iowa. Pasture is also impor-

tant in the Lake States, the Ohio Valley, New York, and New England. The Southern States have comparatively little pasture.

Figure 2 shows the relative importance of pasture as compared with total farm land. Only six counties east of the 99th meridian have 90 per cent of the farm land in pasture and only a small number of counties have over 50 per cent. In much of the area

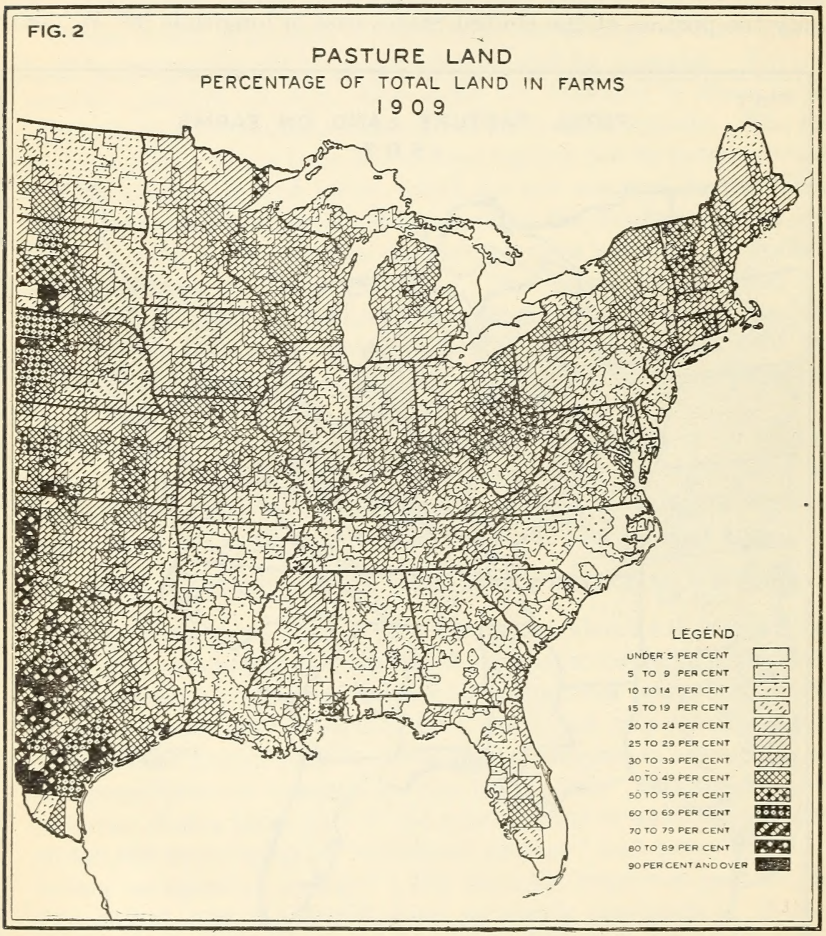


FIG. 2

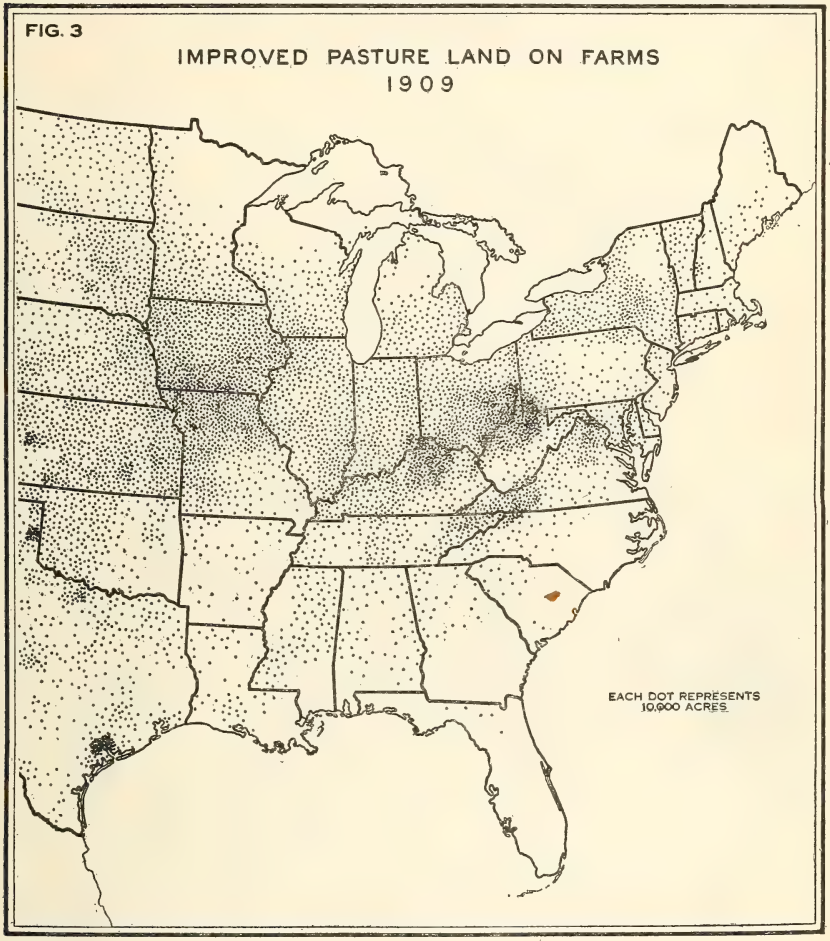
90 PER CENT AND OVER

where corn and winter wheat are grown, pasture comprises from one-fifth to one-half of the total farm land. In many of these areas pasture occupies a regular place in a three-year or four-year system of rotation.

Figure 3 shows that it is in the great agricultural States that improved pasture is mostly concentrated. The most important areas are in eastern Ohio and northern West Virginia, Kentucky, Iowa,

and northern Missouri. Improved pasture is unimportant in the Cotton States. The dense area shown in southern Texas is probably due to defective classification. Woodland pasture (shown in figure 4) is, on the other hand, markedly concentrated in Texas, and is distributed fairly evenly throughout the eastern half of the country. This Texas woodland pasture is, in the main, brush-land, largely



mesquite. In the Southern States there are vast tracts of forest land; nevertheless woodland pasture is not as dense as in the Northern States, and in part of the South it is practically nonexistent. This is due partly to the lack of species of grass well adapted to pasture, and partly to economic conditions which make unprofitable any utilization of poor pastures. There is a noticeable belt of woodland pasture in Minnesota and western Wisconsin, owing in part, to the rolling or hilly topography.

Unimproved pasture other than woodland pasture (fig. 5) is distributed more densely through the Great Plains region largely because much improved range land is included in the pasture figures. In the East unimproved pasture is distributed somewhat more densely through the Northern than through the Southern States and is most dense in Vermont and parts of northern New York.

The pasture reported as unimproved by the enumerators in the East is largely land that is too rough for cultivation, and in the West is largely grazing land where the rainfall is too low for the production of staple crops.

Figure 6 shows the distribution of farm land that is in neither crops nor pasture. As explained above, this type of farm land comprises woodland, waste, and fallow land, as well as yards, barnyards,

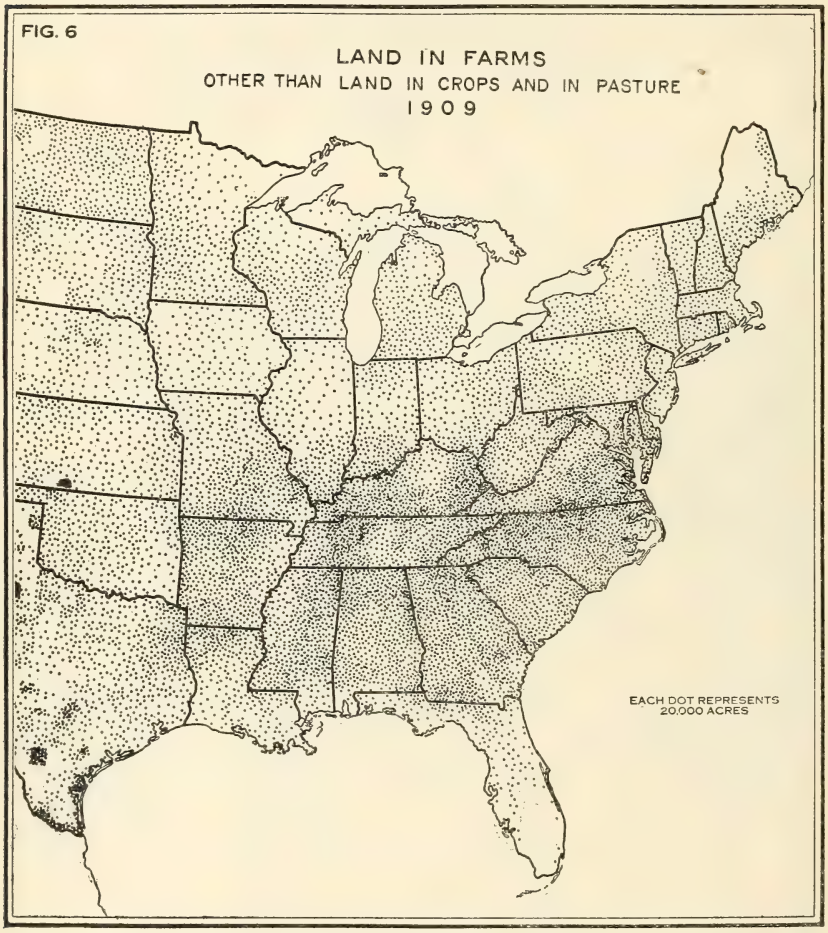
roads, etc.; in short, all farm land that is not utilized directly for agricultural production. In New England, in the South Atlantic and East South Central States, as well as in Arkansas and Louisiana, a large proportion of this land is in forests and marshes. On the other hand, in parts of North Dakota, South Dakota, Nebraska, and Kansas, as well as in the Western States, an appreciable pro-

portion of the cultivated area remains idle every year because of the practice of summer fallowing. It therefore can not be considered as waste land.

The regions of sparsest distribution of land not in crops or pasture are at the two extremes of agricultural conditions. On the one hand, there is little unused farm land in places where there are few farms, as in northern Maine and the Adirondacks, and on the

other hand, there is little unused farm land in the most fertile agricultural regions where nearly all the land in farms is utilized, as in Illinois and Iowa.

Land not in farms.—In this connection it is interesting to consider the amount and distribution of land not in farms. These figures



are derived by subtracting the land in farms as reported by the Bureau of the Census from the total land area of counties as reported by the same authority. The following table presents the results by geographic divisions and States, and figure 7 shows the distribution of land not in farms by counties:

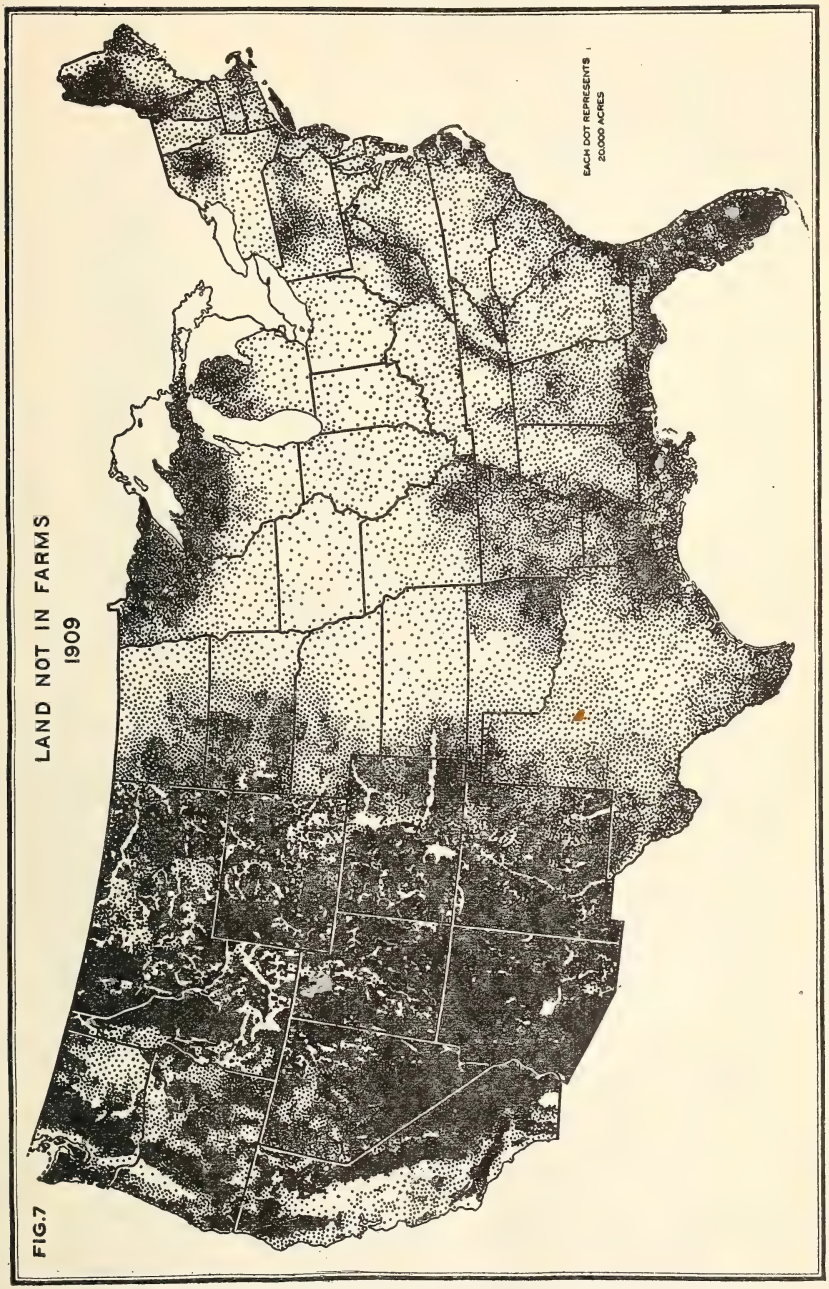


FIG.7

Lands not in farms: 1910.

Division or State.	Acreage.	Per cent of total land area.	Division or State.	Acreage.	Per cent of total land area.

Kansas	8,950,561	17.1			

The total acreage not in farms in the United States in 1909 was 1,024,491,275, or 53.8 per cent of the total land area. The greater part of this unused land was in the western half of the United States. It will be noted that in some counties in Texas there was no land not in farms reported. In fact, in these counties there was more land reported in farms than the entire land area of the counties. The reason for this discrepancy is that the farm acreage is assigned in tabulation to the county where the farmstead is located, and in these Texas counties there were many farms with farmsteads in one county and large acreages in adjoining counties.

The map in general indicates the regions where little expansion of farm acreage is possible. This is the case throughout the corn belt, in most of the spring-wheat region, and in central New York. The uncleared areas along the northern border and in Arkansas and Oklahoma appear clearly on the map, as well as the forested and marshy regions along the Gulf and South Atlantic coasts. The wheat-producing areas of eastern Washington, the Willamette Valley of western Oregon, and the valleys of California, are regions of the greatest expansion of agriculture in the West. In these localities there was comparatively little land not in farms in 1909.

In the eleven Rocky Mountain and Pacific States over 85 per cent of the land area was not in farms in 1909, and a great deal of this land is destined to remain permanently non-agricultural. Where the land is too rough for agriculture and the rainfall sufficient for the growth of trees, the land is included in the national forests, which are shown as solid black areas in figure 7. Desert areas and several Indian reservations, which had not been opened for settlement in 1909, are also shown in black.

NOTE 1.—The schedules from which the material was tabulated had been moved to a storage room and some of the schedules were lost or mislaid. The following table shows the number of the missing records and the States and counties affected:

Missing records.

State and county.	Number of farms.	Missing records.	
		Number	Per cent of total.

Walworth	2,803	807	28.8

[1] Pasture figures for missing records in these counties were estimated on the basis of average acreage in adjoining counties with similar agricultural conditions.

It will be seen from the foregoing table that of the total number of 6,362,000 farms, schedules for about 12,000, or one-fifth of 1 per cent, were missing. The missing records therefore do not affect perceptibly the figures for the United States or even for any State, the largest proportion of missing records, 2 per cent, affecting the figures

for Nevada. In counties whose missing records constituted a comparatively small percentage of the total number of farms, the pasture acreage on the farms whose records were missing was estimated on the basis of averages for farms whose records were on hand. But in counties whose missing records constituted a very large proportion of the total number of farms the estimates were made on the basis of average acreage per farm for adjoining counties having similar agricultural conditions. There are, therefore, about seven counties for which the figures are estimates and possibly inaccurate, but for the remaining counties and for States and the United States the figures are as reliable as could be obtained by the method of enumeration.

NOTE 2.—By subtracting the figures for woodland pasture from those for the total woodland on farms, as reported by the census, a measure of the amount of land in woodlots not pastured could have been obtained if it were not for the difference in definitions. The census definition of woodland pasture is given on page 1, and woodland on farms was defined as follows:

> Woodland in this farm. (Give here land covered with natural or planted forest trees, whose principal value is in firewood, timber, or other forest products, which it will now or later yield.)

Woodland pasture, therefore, according to the definition, includes a large territory of open pasture with scattered trees, and naturally this territory would not be reported as woodland. As a matter of fact the acreage reported for woodland pasture was, in many counties, and even in many States, considerably in excess of the total acreage for woodland. Nevertheless, it was considered worth while to show in Table I the percentage of farm land not used for crops or pasture which was in woodland and in all other kinds of land not otherwise specified, with the understanding that these figures are only rough approximations.

In the case of a few counties the reported pasture land is greater than the entire farm land, exclusive of land in crops, and in some others pasture land alone, as reported, is greater than the total land in farms. These discrepancies probably are due to the fact that in some cases, especially in the range States, the farmer would report as pasture a great deal of range land that he did not report as part of his farm. It was deemed advisable to let the reports stand as made, because there was no evidence on which to base any editorial revision. It will be understood, therefore, that these paradoxical returns are presented exactly as made by the enumerators. The following table gives the list of counties from which an excessive acreage in pasture was reported and the amount of the excess. This excess makes it obvious that the figures given for these counties in the column headed "All other farm land" were minus quantities.

In Table II the minus quantities are not given, but a reference is made to this list. The State totals for this column equal the sum of the figures shown for counties less the minus quantities reported for the counties here listed.

Counties reporting an excessive acreage in pasture.
